Instructions to Run the code :

1. As code size is high (1.3 Mb) , first it will show " Local host Not responding " error while opening the code in jupyter, but you still have to wait for a while, the file will definitely get open afterwards,

2. As code has some commented lines, you don't need to focus on that even if it has codes in it.

3. Because of the negligible size of missing values data (0.5 % missing values) , I have dropped missing values instead of imputing them.

4. R sqr , RMSE shown in project Report may differ slightly at the time of running because of random selection values for Training set/ Test set.

5. As I have specially focused on Python code, so for better understanding of Project , I request you to please take python file as a reference.
